

# Experience a Reimagined and Streamlined Primary Care Referral Process with Vim's Order Assist Solution

The Order Assist solution gives the right context at the right time to assist care teams in the selection of high-performing, in-network referral destinations (specialty physicians, radiology, labs, and ambulatory surgical centers) directly within EHR referral workflows. **No more static referral lists or poor patient experience** due to out-of-network or low-quality referrals.

During an order workflow in the EHR, Order Assist will auto-populate any information already entered into the EHR into filterable search fields such as ICD/Condition and Speciality without leaving the existing workflow. Results include relevant details such as estimated out-of-pocket cost, Premium Designation indicators/badges, and proximity to the patient. And with EHR write-back upon referral selection, care teams enjoy fewer clicks and less burden.

**Unlock powerful insights** at the point of care and within existing EHR order workflows ensuring in-network, high-quality referral destinations are selected for exceptional patient experience.

**Encourage continued care adherence** with powerful search filters including proximity to patient's home address. Order Assist applies to specialists, radiology, labs and ambulatory surgical centers.

**Drive standardized behavior** to support a consistent clinic experience and results while maintaining physician or care team choice in selecting the best referral for patient's specific needs.
