# With Vim's Patient Health History, Review a Patient's Recent Claims History with Context and Without Historical Fact-Finding

The Patient Health History application transforms the patient-physician health history conversation. It provides an at-a-glance window into a patient's health history using the most recent 13 months of claims-based data that is delivered within the EHR during active workflows.

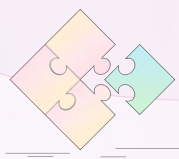

Patient Health History expands a care team's awareness of a patient's recent health history — beyond the walls of their own clinic — without relying solely on a patient's recall or wasting time re-writing (or retyping) history pulled from Health Information Exchanges (HIEs), portals, and other disconnected sources.

Gain enhanced visibility and deliver higher quality, coordinated care with ability to focus on the patient and understand their health at a more meaningful level.

Gain more breadth and depth of patient data while maintaining an easy-to-read and at-a-glance format not found in portals and other data silos - no more digging through HIEs.

Build care plans instead of relying on piecing together information from a patient's memory - stop the guesswork and patient quizzing.
